– under construction –

1. Launch Xcode 5.
2. File: New: Project...
3. Click “Command Line Tool” and click Next.
4. Provide information about the project and click Next.
5. Create a new folder in the desired location and click Create.
6. Remove the default main.cpp and add your own sources. If you want a skeleton project, create the sources required for a standalone orx project.
7. Build Phases
8. Add resource files.
9. Build Settings
10. User Header Search Paths
11. Library search paths
12. Other linker flags
